1. Write a Java program to read a text file and count:

- **Number of lines**
- **Number of words**
- **Number of characters**

Code:

```
import java.io.*;
public class FileCount {
    public static void main(String[] args) throws Exception {
        BufferedReader br = new BufferedReader(new FileReader("data.txt"));
        String line;
        int lineCount = 0;
        int wordCount = 0;
        int charCount = 0;

        while ((line = br.readLine()) != null) {
            lineCount++;
            charCount += line.length();
            String words[] = line.trim().split("\\s+");
            if (line.trim().length() != 0) {
                wordCount += words.length;
            }
        }
        br.close();
        System.out.println("Number of lines: " + lineCount);
        System.out.println("Number of words: " + wordCount);
        System.out.println("Number of characters: " + charCount);
    }
}
```

2. Append Data to File

Write a program to:

• Take user input

• Append that data into an existing file without deleting previous content

Code:

```java
import java.io.*;
import java.util.Scanner;

public class AppendToFile {
    public static void main(String[] args) throws Exception {

        // Take input from user
        Scanner sc = new Scanner(System.in);
        System.out.print("Enter text: ");
        String input = sc.nextLine();

        // Open file in append mode (true)
        FileWriter fw = new FileWriter("data.txt", true);

        fw.write(input);
        fw.write("\n"); // move to next line

        fw.close();

        System.out.println("Data appended successfully");
    }
}
```

3. Buffered Reader Usage

Write a Java program to read a file using BufferedReader and print only those lines that contain the word "Java".

Code:

```
import java.io.*;
public class FilterJavaLines {
    public static void main(String[] args) throws Exception {
        BufferedReader br = new BufferedReader(new FileReader("data.txt"));
        String line;
        while ((line = br.readLine()) != null) {
            if (line.contains("Java")) {
                System.out.println(line);
            }
        }

        br.close();
    }
}
```

4. Count Specific Word in File

Write a program to count how many times a specific word (e.g., "Java") appears in a file

Code:

```
import java.io.*;

public class CountWord {
    public static void main(String[] args) throws Exception {

        BufferedReader br = new BufferedReader(new FileReader("data.txt"));

        String line;
        int count = 0;
        String target = "Java";

        while ((line = br.readLine()) != null) {

            String words[] = line.split("\\s+");

            for (String word : words) {
                if (word.equals(target)) {
                    count++;
                }
            }
        }

        br.close();

        System.out.println("Occurrences of '" + target + "' : " + count);
    }
}
```
